### The rise and decline of development economics

much better than the object of its study, the economic development of the poorer regions of the world, located primarily in because of a sudden spurt in economic development, but rather because the forward movement of our subdiscipline has notably slowed down. This is of course a subjective judgment. Articles and books are still being produced. But as an observer and longtime participant I cannot help feeling that the old liveliness is no longer there, that new ideas are ever harder to come by and that Asia, Latin America, and Africa. Lately it seems that at least this particular gap has been narrowing, not so much unfortunately quiry. It was born just about a generation ago, as a subdiscipline of economics, with a number of other social sciences looking on both skeptically and jealously from a distance. The forties and especially the fifties saw a remarkable outpouring of fundamental ideas and models which were to dominate the new field and In that eminently "exciting" era, development economics did Development economics is a comparatively young area of into generate controversies that contributed much to its liveliness. the field is not adequately reproducing itself.

recently. See, in particular, Paul Streeten, "Development ideas in historical perspective," in Toward a New Strategy for Development, Rothko Chapel Colloquium (New York: Pergamon Press, 1979), pp. 21–52, and Fernando Henrique Cardoso, "The originality of a copy: CEPAL and the idea of development," CEPAL Review (second half of 1977), UN Commission for Latin America, UN Publication E.77.II.G.5, pp. 7–40. See also the introductory section of Chapter 4 for a brief review of "theorizing on selective review. In particular, it does not treat the development of our factual knowledge about the development process which has often included the testing of This retrospective essay, which is also to appear in the forthcoming collection in honor of Sir Arthur Lewis (London: George Allen and Unwin), is of course a highly theories; here the main debt is owed to such figures as Simon Kuznets and Hollis Chenery. A number of other surveys of the sort here attempted have appeared economic development in historical perspective" with a rather different focus.

why, after a while, interest in this activity should flag. One is bly shock-free growth experienced during that period by the When scientific activity is specifically directed at solving a pressing problem, one can immediately think of two reasons that the problem is in fact disappearing-either because of the scientific discoveries of the preceding phase or for other reasons. For example, the near demise of interest in business-cycle theory since the end of World War II was no doubt due to the remarkaadvanced industrial countries, at least up to the mid-seventies. But this reason cannot possibly be invoked in the present case: The problems of poverty in the Third World are still very much with us.

ing realization that a "solution" is by no means at hand and that little if any progress is being made. Again, this explanation does not sound right in our case, for in the last thirty years considerable advances have taken place in many erstwhile "underdeveloped" countries—even a balance sheet for the Third World as a The other obvious reason for the decline of scientific interest in a problem is the opposite experience, that is, the disappointwhole is by no means discouraging.1

world poverty is far from solved, but encouraging inroads on the problem have been and are being made. It is therefore something In sum, the conditions for healthy growth of development economics would seem to be remarkably favorable: the problem of of a puzzle why development economics flourished so briefly.

can be shown, I believe, that this happened as a result of an a priori unlikely conjunction of distinct ideological currents. The conjunction proved to be extraordinarily productive, but also geneous ideological makeup, the new science was shot through with tensions that would prove disruptive at the first opportunity. Secondly, because of the circumstances under which it In looking for an explanation, I find it helpful to take a look at the conditions under which our subdiscipline came into being. It created problems for the future. First of all, because of its heteroarose, development economics became overloaded with unrea-Put very briefly and schematically, this is the tale I shall tellsonable hopes and ambitions that soon had to be clipped back. plus a few stories and reflections on the side.

The rise and decline of development economics

# I. A simple classification of development theories

The develpment ideas that were put forward in the forties and They also were based on one unspoken political assumption fifties shared two basic ingredients in the area of economics. with which I will deal in the last section of this paper.

respects when dealing with underdeveloped countries. The mutual-benefit claim is the assertion that economic relations The two basic economic ingredients were what I shall call the mutual-benefit claim. By rejection of the monoeconomics claim I set apart, through a number of specific economic characteristics common to them, from the advanced industrial countries and that traditional economic analysis, which has concentrated on the industrial countries, must therefore be recast in significant between these two groups of countries could be shaped in such a way as to yield gains for both. The two claims can be either rejection of the monoeconomics claim and the assertion of the mean the view that underdeveloped countries as a group are asserted or rejected, and, as a result, four basic positions exist, as shown in the following table.

Types of development theories

claim: assertea Orthodox Development economics economics rejected Marx? Neo-Marxist	Mutual-benefit	asserted rejected	Monveconomics claim:
---	----------------	-------------------	----------------------

and modern development economics, on the other. I shall take comprehensive typology for the major theories on development neo-Marxism, and two other less consistent positions that are velopment of "backward" and colonial areas, on the one hand, Even though there are of course positions that do not fit neatly just one of its cells, this simple table yields a surprisingly of the periphery. In the process, it makes us realize that there are two unified systems of thought, orthodox economics and therefore likely to be unstable: Marx's scattered thoughts on de-

<sup>&</sup>lt;sup>1</sup> See, for example, David Morawetz, Twenty-Five Years of Economic Development: 1950 to 1975 (Washington, D.C.: World Bank, 1977).

up these four positions in turn, but shall give major attention to development economics and to its evolving relations with-and harassment by - the two adjoining positions.

nomic intercourse ("or else they would not engage in those ful" theorems of universal validity: there is only one economics "just as there is only one physics"); (b) one of these theorems is that, in a market economy, benefits flow to all participants, be they individuals or countries, from all voluntary acts of eco-The orthodox position holds to the following two propositions: (a) economics consists of a number of simple, yet "poweracts"). In this manner, both the monoeconomics and the mutualbenefit claims are asserted.

"center"; (b) as a result of this long process of exploitation, the it has been argued that they cannot have a successful industrialchange" is the essential, permanent feature of the relations between the underdeveloped "periphery" and the capitalist political-economic structure of the peripheral countries is very different from anything ever experienced by the center, and their zation experience under capitalist auspices. Here, both the mu-The opposite position is that of the major neo-Marxist theories of development which hold: (a) exploitation or "unequal exdevelopment cannot possibly follow the same path – for example, tual-benefit claim and the monoeconomics claim are rejected.

most developed country does nothing but hold up to those who follow it on the industrial ladder, the image of its own future," A cozy internal consistency, bent on simplifying (and oversimplifying) reality and therefore favorable to ideology formation, is immediately apparent in both the orthodox and the neo-Marxist positions. This is in contrast with the remaining two positions. It should be clear why I have placed Marx into the southwesterly cell (mutual-benefit claim rejected, monoeconomics claim asserted). Writing in Capital on primitive accumulation on the one hand, Marx describes the process of spoliation to which the periphery has been subject in the course of the early development of capitalism in the center. Thus he denies any claim of mutual benefit from trade between capitalist and "backward" countries. On the other hand, his well-known statement, "The industrially coupled with the way in which he viewed England's role in India as "objectively" progressive in opening the way to indusrialization by railroad construction, suggests that he did not

The rise and decline of development economics

firmly in the southeasterly cell took considerable labors (which perceive the "laws of motion" of countries such as India as being the question mark in the table. But to root neo-Marxist thought nent of the thought of Marx). The story of these labors and revisions has been told elsewhere,2 and my task here is to deal with the origin and dynamics of the other "hybrid" position: substantially different from those of the industrially advanced plex and subject to a range of interpretations, as is indicated by involved, among other things, uprooting an important compoones. Marx's opinions on this latter topic are notoriously comdevelopment economics.

quired for the creation of a separate theoretical structure, and the forms in international economic relations. In the absence of this perception it would simply not have been possible to mobilize a (a) certain special features of the economic structure of the underdeveloped countries make an important portion of orthodox for relations between the developed and underdeveloped countries to be mutually beneficial and for the former to contribute to the development of the latter-was essential for our subdiscipline second was needed if Western economists were to take a strong interest in the matter—if the likelihood or at least the hope could be held out that their own countries could play a positive role in analysis inapplicable and misleading, and (b) there is a possibility to arise where and when it did: namely, in the advanced industrial countries of the West, primarily in England and the United States, at the end of World War II. The first proposition is rethe development process, perhaps after certain achievable re-It is easy to see that the conjunction of the two propositions large group of activist "problem solvers."

#### II. The inapplicability of orthodox monoeconomics to underdeveloped areas

Once a genuinely new current of ideas is firmly established and is being busily developed by a large group of scholars and re-

On the complexity of Marx's views, even in the preface of Capital where the cited phrase appears, see Chapter 4, this volume, pp. 89–90. <sup>2</sup> B. Sutcliffe, "Imperialism and Industrialization in the Third World," in R. Owen and B. Sutcliffe, eds., Studies in the Theory of Imperialism (London: Longman, 1972), pp. 180-

cult it was for the new to be born and to assert itself. Such difficulties are particularly formidable in economics with its dominant paradigm and analytical tradition-a well-known Accordingly, there is need for an explanation of the rise and at claim that large portions of the conventional body of economic thought and policy advice are not applicable to the poorer countries-the more so as much of this intellectual movement arose in the very "Anglo-Saxon" environment which had long served searchers, it becomes almost impossible to appreciate how diffisource of both strength and weakness for that social science. least temporary success of the heretical, though today familiar, as home for the orthodox tradition.

of the thirties, which became the "new economics" and almost a lished the view that there were two kinds of economics: one-the orthodox or classical tradition - which applied, as he was wont to put it, to the "special case" in which the economy was fully employed; and a very different system of analytical propositions and over when there was substantial unemployment of human and material resources.3 The Keynesian step from one to two economics was crucial: the ice of monoeconomics had been broken and the idea that there might be yet another economics had instant credibility-particularly among the then highly influential group discredit orthodox economics had fallen into as a result of the depression of the thirties and of the equally unprecedented success of an attack on orthodoxy from within the economics "establishment." I am talking of course about the Keynesian Revolution new orthodoxy in the forties and fifties. Keynes had firmly estabof policy prescriptions (newly worked out by Keynes) that took Development economics took advantage of the unprecedented Elements of such an explanation are actually not far to seek. of Keynesian economists, of course.

Among the various observations that were central to the new development economics and implicitly or explicitly made the case for treating the underdeveloped countries as a sui generis

The rise and decline of development economics

group of economies, two major ones stand out, that relating to rural underemployment and that stressing the late-coming syndrome in relation to industrialization.

kinds of economics. Such a connection was achieved by the unanimous stress of the pioneering contributions-by Kurt Mandelployment as a crucial characteristic of underdevelopment. The jocus on rural underemployment was sufficiently similar to the Keynesian concern with unemployment to give the pioneers a proposition that different kinds of economies require different baum, Paul Rosenstein-Rodan and Ragnar Nurkse-on underemyet it was also different enough to generate expectations of even-1. Rural underemployment. The early writers on our subject may have looked for an even closer and more specific connection with the Keynesian system than was provided by the general highly prized sensation of affinity with the Keynesian system, tual independent development for our fledgling branch of economic knowledge.

and advocated some form of public investment planning that those of an underdeveloped economy with rural underemployment were both held to justify interventionist public policies ians stressed the task of expansionary fiscal policy in combating would mobilize the underemployed for the purpose of industritics of an advanced economy with urban unemployment and unemployment. The early development economists went farther The affinities were actually quite impressive. As is well riously than had been done by traditional economics and had elaborated a theory of macroeconomic equilibrium with unemployment. Similarly, the early development economists wrote at equilibrium—which can prevail under conditions of widespread rural underemployment. Moreover, the equilibrium characterishitherto strictly proscribed by orthodox economics. The Keynesknown, the Keynesian system took unemployment far more selength about the "vicious circle of poverty" – a state of low-level alization, in accordance with a pattern of "balanced growth."

nomics to stand as a separate body of economic analysis and policy derived intellectual legitimacy and nurture from the prior In these various ways, then, the claim of development ecosuccess and parallel features of the Keynesian Revolution

The focus on rural underemployment as the principal charac-

Dudley Seers leaned on this established terminological usage with his article "The Limitations of the Special Case," Bulletin of the Oxford University Institute of Economics and Statistics, 25 (May 1963): 77-98, in which he pleaded for recasting the teaching of economics so as to make it more useful in dealing with the problems of the lessdeveloped countries. The "special case" that had falsely claimed generality was, for Keynes, the fully employed economy; for Seers, it was the economy of the advanced capitalist countries, in contrast to conditions of underdevelopment.

teristic of underdevelopment found its fullest expression in the most miraculously-to squeeze out of the simple proposition about underemployment a full set of "laws of motion" for the commendations for domestic and international economic policy. opment with Unlimited Supplies of Labour" he managed-altypical underdeveloped country, as well as a wide range of rework of Arthur Lewis. In his powerful article "Economic Devel-

With the concept of rural underemployment serving as the ment economics, it is not surprising that it should have been monoeconomics.4 For example, Theodore W. Schultz devoted a full chapter of his well-known book Transforming Traditional Agriculture (Yale, 1964) to an attempt at refuting what he called "The Doctrine of Agricultural Labor of Zero Value."5 This suggests an interesting point about the scientific status of economics, and of social science in general. Whereas in the natural or medical sciences Nobel prizes are often shared by two persons who have crucial theoretical underpinning of the separateness of developchosen as a privileged target by the defenders of orthodoxy and collaborated in, or deserve joint credit for, a given scientific advance, in economics the prize is often split between one person who has developed a certain thesis and another who has labored mightily to prove it wrong.

ment of labor as well as of other factors of production, whereas At the outset of his celebrated article, Lewis had differentiated the underdeveloped economy from Keynesian economics by pointing out that in the Keynesian system there is underemployin an underdevelopment situation only labor is redundant. In this respect, my own work can be viewed as an attempt to generalize the diagnosis of underemployment as the characteristic eature of underdevelopment. Underdeveloped countries did

The rise and decline of development economics

have hidden reserves, so I asserted, not only of labor, but of savings, entrepreneurship, and other resources. But to activate them, Keynesian remedies would be inadequate. What was needed were "pacing devices" and "pressure mechanisms"; whence my strategy of unbalanced growth.

developed countries. 6 A feature I had presented as being specific have somewhat undermined the claim of development economics "satisficing" and that of Harvey Leibenstein on "X-efficiency" ties that are hidden, scattered, or badly utilized"-that was the way I had put it in The Strategy of Economic Development for the less to the situation of one group of economies was later found to fication of our science, what we have here is not a return of the to autonomy and separateness. As the work of Herbert Simon on were to show, the performance of the advanced economies also "depends not so much on finding optimal combinations for given resources as on calling forth and enlisting . . . resources and abiliprevail in others as well. Whereas such a finding makes for reuniprodigal son to an unchanging, ever-right and -righteous father. Rather, our understanding of the economic structures of the West will have been modified and enriched by the foray into other My generalization of the underemployment argument may economies

have in fact prevailed in many "Northern" economies during the immigration, temporary or permanent, spontaneous or organized, from the "South." One of the more interesting analytical This kind of dialectical movement-first comes, upon looking at outside groups, the astonished finding of Otherness, and then follows the even more startling discovery that our own group is not all that different-has of course been characteristic of anthropological studies of "primitive" societies from their beginning and has in fact been one of their main attractions. In the field of development economics, something of this sort has also happened to the ideas put forward by Arthur Lewis. The dypostwar period of rapid growth, owing in large part to massive namics of development with "unlimited" supplies of labor, responses to this situation has been the dual labor market theory which was supposed to be typical of less developed countries,

ployment," in Contribuições à Análise do Desenvolvimiento Econômico (Essays in honor of See, for example, Jacob Viner, "Some Reflections on the Concept of 'Disguised Unem-Eugênio Gudin), (Rio de Janeiro: Agir, 1957), pp. 345-54.

<sup>&#</sup>x27;Reflections on Unlimited Labor," in International Economics and Development: Essays in His principal empirical argument was the actual decline in agricultural output suffered when the labor force suddenly diminished in a country with an allegedly redundant tion of zero marginal productivity in agriculture would remain fully in force provided only the supply of labor at the given wage in industry exceeds the demand, a condition that is much weaker than that of zero marginal productivity. See W. Arthur Lewis, labor force in agriculture, as happened during the 1918-19 influenza epidemic in India. Arthur Lewis pointed out later that the consequences he had drawn from the assump-Honor of Raúl Prebisch (New York and London: Academic Press, 1972), pp. 75-96.

the Lewis model, even though that connection has not been of Michael Piore and others. This theory is easily linked up with made explicit as far as I know.

finity to the Keynesian system and because of the desire of the ment," that served to enhance the scientific aura and status of 2. Late industrialization. I have suggested in the preceding pages that the concept of underemployment achieved its position as foundation stone for development economics because of its afearly writers on our subject to place themselves, as it were, under the protection of a heterodoxy that had just recently achieved success. There was, moreover, something arcane about the concept, often also referred to as "disguised unemploythe new field.

ander Gerschenkron), minimum critical effort (Harvey Leibena deliberate, intensive, guided effort. Naming and characterizing Rosenstein-Rodan), takeoff (Walt W. Rostow), great spurt (Alex-The discussion around these concepts drew on both theoretical arguments-new rationales were developed for protection, plan-"late-coming" conditions was obviously a formidable task that the industrial ventures appropriate to any country would be promptly acted upon by perceptive entrepreneurs and would attract the required finance as a result of the smooth working of capital markets. The long delay in industrialization, the lack of entrepreneurship for larger ventures, and the real or alleged presence of a host of other inhibiting factors made for the conviction that, in underdeveloped areas, industrialization required this effort led to a competition of metaphors: big push (Paul stein), backward and forward linkages (Albert O. Hirschman). notions was required. It became clear during the depression of tries had long specialized or had been made to specialize in the production of staples for export to the advanced industrial countries which had supplied them in return with modern manufactures. To build up an industrial structure under these led to the questioning of received doctrine according to which Along with the mysteries, however, the common sense of the thirties and even more during World War II that industrialization was going to hold an important place in any active development policy of many underdeveloped countries. These coundevelopment also suggested that some rethinking of traditional

ning, and industrialization itself-and on the experience of European industrialization in the nineteenth century

The rise and decline of development economics

content for all countries, no matter when they started out on the country lumbering through [Rostow's] pentametric rhythm"8 and showed, to the contrary, how the industrialization of the the historically oriented, Gerschenkron's work supplied the same minded: he showed once and for all that there can be more than one path to development, that countries setting out to become Rostow and Gerschenkron. Even though Rostow had coined velopment process into his famous five "stages" with identical road to industrialization. Gerschenkron derided the notion "that the process of industrialization repeated itself from country to late-coming European countries such as Germany and Russia revolution, largely because of the intensity of the "catching-up" effort on the part of the latecomers. Even though it was limited to nineteenth-century Europe, Gerschenkron's work was of torical support for the case against monoeconomics. As industrialization actually proceeded in the periphery, it appeared that Third World industrialization around mid-twentieth century exhibited features rather different from those Gerschenkron had identified as characteristic for the European latecomers.<sup>9</sup> But for kind of reassurance Keynesianism had given to the analytically In the latter respect, the struggle between advocates and adversaries of monoeconomics was echoed in the debate between what became the most popular metaphor (the "takeoff"), he had really taken a monoeconomics position. For he divided the dediffered in fundamental respects from the English industrial great importance for development economics by providing hisindustrialized are likely to forge their own policies, sequences, and ideologies to that end.

proaches. For example, modern, capital-intensive industry was found to be less effective in absorbing the "unlimited supplies of labor" available in agriculture than had been the case in the course of earlier experiences of industrialization. Advances in Subsequent observations strengthened the conviction that industrialization in the less developed areas required novel ap-

tions about the adequacy of traditional remedies and led, in Latin America, to the "sociological" and "structuralist" theses on inflation, which, interestingly, have now gained some currency in the advanced countries, usually without due credit beeconomy" questions about the extent to which a country should attract, restrict, or control these purveyors of modern technology industrialization were frequently accompanied by persistent inflationary and balance-of-payment pressures which raised quesing given. 10 Also, the vigorous development of the transnational corporation in the postwar period raised entirely new "political and products.

## III. The mutual-benefit assumption

earlier, with the proposition that the core industrial countries could make an important, even an essential, contribution to the that was built up in this manner was closely connected, as noted The new (far from unified) body of doctrine and policy advice development effort of the periphery through expanded trade, financial transfers, and technical assistance.

larged economic relations between rich and poor countries countries that became common in the fifties. These exercises invariably contained projections for an expansion of trade and aid. Their underlying assumption was necessarily that such enwould be beneficial for both. Now this proposition fits nicely that such an effort could only be mounted with substantial help from the advanced countries, as the poor countries were unable to generate the needed savings from within. Here the underlying model was the new growth economics, which, in its simplest (Harrod-Domar) version, showed a country's growth rate to be determined by the propensity to save and the capital-output ratio. Growth economics had evolved independently from development economics, as a direct offshoot of the Keynesian system and its macroeconomic concepts. While devised primarily with the advanced industrial countries in mind, it found an early practical application in the planning exercises for developing The need for large injections of financial aid fitted particularly well into those theories advocating a "big push." It was argued

The rise and decline of development economics

growth path? Why are they so impoverished in spite of having long been drawn into the famous "network of world trade" into orthodox monoeconomics, but it might have been expected to arouse some suspicion among development economists and to mix rather poorly with some of the other elements and assertions asked, why are the countries of the South in a state where, according to some, it takes a huge push to get them onto some which was supposed to yield mutual benefits for all participants? caught in the net to be victimized by some imperialist spider? But such indelicate questions were hardly put in the halcyon days of the immediate postwar years, except perhaps in muted tones by a of the new subdiscipline. For example, so it could have been is it perhaps because, in the process, some countries have been few faraway voices, such as Raúl Prebisch's. Of that more later.

the marriage between the new insights about the sui generis economic problems of the underdeveloped countries and the this marriage, in spite of the incompatibilities involved, was the success of the Marshall Plan in Western Europe. Here the task of with some economic planning and cooperation on the part of the aid recipients. It has often been pointed out that this European success story led to numerous failures in the Third World, that it Action-oriented thought seldom excels in consistency. Development economics is no exception to this rule; it was born from overwhelming desire to achieve rapid progress in solving these problems with the instruments at hand, or thought to be within reach, such as large-scale foreign aid. A factor in "arranging" thanks, so it appeared at least, to a combination of foreign aid amentably blocked a realistic assessment of the task of developpostwar reconstruction was mastered with remarkable speed, ment, in comparison with that of reconstruction.

But the matter can be seen in a different light. True, the success of the Marshall Plan deceived economists, policymakers,

<sup>&</sup>quot;This was the title of a well-known League of Nations study stressing the benefits of multilateral trade which were being threatened in the thirties by the spread of bilateralwhich was published only in processed form in the proceedings of a congress (I have not been able to locate it), was influential in raising questions about the benign effects of international economic relations on the poorer countries. ism and exchange controls. Its principal author was Folke Hilgerdt, a Swedish economist. In the immediate postwar period, Hilgerdt, then with the United Nations, noted that trade, however beneficial, had not adequately contributed to a narrowing of income differentials between countries. With Hilgerdt coming from the Heckscher-Ohlin tradition and having celebrated the contributions of world trade to welfare, this paper,

The rise and decline of development economics

(and which will be discussed later in this essay), would we not But-and here is an application of what I have called the "Principle of the Hiding Hand" - on balance it may have been a good thing that we let ourselves be so deceived. Had the toughness of the development problem and the difficulties in the North-South relationship been correctly sized up from the outset, the considerable intellectual and political mobilization for the enterprise would surely not have occurred. In that case, and in spite of the various "development disasters" which we have experienced be even farther away from an acceptable world than we are and enlightened opinion in the West into believing that infusion of capital helped along by the right kind of investment planning might be able to grind out growth and welfare all over the globe.

development enterprise and thereby to help place it on the In sum, one historical function of the rise of development economics was to inspire confidence in the manageability of the agenda of policymakers the world over. The assertion of the mutual-benefit claim served this purpose.

#### IV. The strange alliance of neo-Marxism and monoeconomics gainst development economics

dency." The two fundamentalist critiques attacked development economics from opposite directions and in totally different terms: but they could converge in their specific indictments-as nomic structure and in their relations to the rich countries could make a difference; pending such change, so-called development policies only created new forms of exploitation and "depenthey indeed did, particularly in the important arena of industriless smooth than had been thought, the hybrid nature of the new subdiscipline resulted in its being subjected to two kinds of through its newfangled policy recommendations, the problem it opment economics had not gone far enough in its analysis of the predicament of the poor countries: so serious was their problem pronounced to be that nothing but total change in their socioeco-Predictably, when the path to development turned out to be far attacks. alization. Because the adherents of neoclassical economics and those of various neo-Marxist schools of thought live in quite in general, that strange de facto alliance has hardly been noted; but it plays an important role in the evolution of thinking on separate worlds, they were not even aware of acting in unison. development and its story must be briefly told.

rently. In 1949, Raúl Prebisch and Hans Singer formulated (sisecular tendency of the terms of trade to turn against countries and underdeveloped countries arose at an early stage among some of the major contributors to the new subdiscipline. There was widespread acceptance of the view that the advanced indusrial countries could henceforth contribute to the development of the less advanced, particularly through financial assistance, but questions were raised in various quarters about the equitable distribution of the gains from trade, both in the past and curmultaneously and independently) their famous "thesis" on the exporting primary products and importing manufactures. 12 They attributed this alleged tendency to the power of trade unions in in the periphery. The argument was put forward to justify a his model in a rather similar direction: as long as "unlimited supplies of labor" in the subsistence sector depress the real wage throughout the economy, any gains from productivity increases in the export sector are likely to accrue to the importing countries; moreover, in a situation in which there is surplus labor at the ruling wage, prices give the wrong signals for resource allocation in general and for the international division of labor in particular; the result was a further argument for protection and Doubts about the harmony of interests between the developed the advanced countries and to conditions of underemployment sustained policy of industrialization. Arthur Lewis was led by industrialization.

Both the Prebisch-Singer and the Lewis arguments showed that without a judiciously interventionist state in the periphery, the

Prebisch and the emergence of the thesis is now available in Joseph Love, "Raúl Prebisch and the Origins of the Doctrine of Unequal Exchange," Latin American Research Review 15 (November 1980): 45–72. See also my earlier essay "Ideologies of Economic Development in Latin America" (1961), reprinted in A Bias for Hope, Chapter 13. The latest review of the ensuing controversy and related evidence is in two articles by John Spraos: "The Theory of Deteriorating Terms of Trade Revisited," Greek Economic Review 1 (December 1979): 15–42, and "The Statistical Debate on the Net Barter Terms of Trade between Primary Commodities and Manufactures," Economic Journal 90 (March 1980): 107-28.

cards were inevitably stacked in favor of the center. On the whole, it looked as though this was the result of some unkind fate rather than of deliberate maneuvers on the center's part. Critics from the Left later took Arthur Lewis to task for viewing unlimited supplies of labor as a datum, rather than as something that is systematically produced by the colonizers and capitalists. Lewis was of course fully aware of such situations and specifically notes at one point that in Africa the imperial powers impoverished the subsistence economy "by taking away the people's land, or by demanding forced labour in the capitalist sector, or by imposing taxes to drive people to work for capitalist employers." For Lewis these practices were simply not a crucial characteristic of the model—after all, a decline in infant mortality could have the same effect in augmenting labor supply as a head tax.

sistent and increasing income disparities within countries; but Myrdal's argument on the possibility of further impoverishment hood of its losing skilled people and other scarce factors, and expense of another-an assertion that would be unthinkable early stage of the debate. Gunnar Myrdal invoked the principle of cumulative causation (which he had first developed in his American Dilemma) in seeking to understand the reason for perof the poor region (or country) was largely based on the likelinistic aspects of the center-periphery relation. The theories just noted attempted to show that the gain from trade might be unequally distributed (perhaps even to the point where one group of countries would not gain at all) but did not go so far as to claim that the relationship between two groups of countries could actually be exploitative in the sense that trade and other forms of economic intercourse would enrich one group at the within the assumptions of the classical theory of international trade. Yet, even this kind of assertion was made at a relatively the notion was easily extended to contacts between countries. also on the possible destruction of its handicrafts and industries. It appears nevertheless that the debate among development economists in the fifties included the canvassing of some antago-

parity-became "polarization effect" under my pen, whereas his from the rich to the poor regions-was named by me "trickling with some care could not but have serious doubts about this view: in Latin America, for example, industrial progress was low ebb. To me, this meant no more than that periods of isolation Independently of Myrdal, I had developed similar ideas: Myrdal's "backwash effect" - the factors making for increasing dis-"spread effect"-the factors making for the spread of prosperity down effect." (Optimal terminology is probably achieved by sibility of the polarization effect being stronger than the spread effect must be taken seriously, and thus went counter not only belief, so eloquently expressed by John Stuart Mill, 15 that contact between dissimilar groups is always a source of all-around progress. Anyone who had observed the development scene pression when contacts with the industrial countries were at a combining Myrdal's "spread" with my "polarization" effects.) We both argued, though with different emphases, that the posto the theory of international trade, but to the broader traditional particularly vigorous during the World Wars and the Great Demay be beneficial and I saw some alternation of contact and opment.16 In any event, both Myrdal and I looked at the polarpolicies as a deus ex machina (as I thought Myrdal did), it is possible to see them as arising out of, and in reaction to, the isolation as creating optimal conditions for industrial develization effects as forces that can be opposed and neutralized by public policies; and I tried to show that instead of invoking such experience of polarization.

A strange thing happened once it had been pointed out that interaction between the rich and poor countries could in certain circumstances be in the nature of an antagonistic, zero-sum game: very soon it proved intellectually and politically attractive to assert that such was the essence of the relationship and that it held as an iron law through all phases of contacts between the capitalist center and the periphery. Just as earlier those brought

its sharpest critics. Second, specific policies which in the early against industrialization emanating from essentially the same as a result of the neo-Marxist writings just noted, some of the early advocates of industrialization had now themselves become stage had been useful in promoting industrialization, though at camp ten, or twenty, or fifty years earlier. But the effectiveness able and might not have carried more weight than warnings of the critique was now greater for various reasons. First of all, single, simple, but to them capital, flaw of these policies: misallocation of resources. By itself this critique was highly predictthe terminology of this essay-were sharpening their own knives for an assault on development policies that had pushed industrialization for the domestic market. In contrast to the multiple indictment from the Left, the monoeconomists concentrated on a monoeconomists-as they should be called in accordance with At just about the same time, the neoclassical economists or 17 This view has been aptly labeled "catastrofismo" by Aníbal Pinto.

the cost of inflationary and balance-of-payments pressures, did run into decreasing returns in the sixties: they achieved less industrialization at the cost of greater inflation and balance-ofpayments problems than before. Third, the practice of deliberate industrialization had given rise to exaggeration and abuse in a number of countries, and it became easy to draw up a list of Fourth, a new set of policies emphasizing exports of manufacures from developing countries became attractive, because of the horrible examples that served to incriminate the whole effort. then rapid expansion of world trade, and the possibilities of success of such policies was demonstrated by countries like Taiwan and South Korea. Under these conditions, the neoclassical strictures became more persuasive than they had been for a long time.

The target of the complementary neo-Marxist and neoclassical writings was not just the new industrial establishment, which in charged with intellectual responsibility for whatever had gone been accomplished by the postwar industrialization efforts in the glish socialist in the tradition of Marx's original position on the broblem of harkward areas, the 1ste Rill Warren 18 the intended victim was the new development economics, which had strongly advocated industrial development and was now wrong. The blows from Left and Right that fell upon the fledgling and far from unified subdiscipline left it, indeed, rather stunned: so much so that the most intrepid defense of what had Third World came not from the old stalwarts, but from an Enfact survived the onslaught rather well; on the ideological plane, problem of backward areas, the late Bill Warren.

## V. The real wounding of development economics

It would of course be silly-just as silly as the German proverb Viel Feind, viel Ehr (many enemies, much honor)-to hold that any doctrine or policy that is attacked simultaneously from both Left and Right is, for that very reason, supremely invested with truth and wisdom. I have already noted that the neoclassical critics made some valid points, just as the neo-Marxists raised a number of serious issues, particularly in the areas of excessive foreign control and of unequal income distribution. But normally

The rise and decline of development economics

education, etc.-that is currently a principal preoccupation of development economics. Just as the construct of the "typical underdeveloped country" gave way to diverse categories of countries, each with characteristics of its own, so did the heretofore unique maximand of development economics (income per capita) dissolve into a variety of partial objectives, each requiring consultation with different experts—on nutrition, public health, housing, and education, among others.

There is of course much to be said for this new concreteness in development studies, and particularly for the concern with the out as the spearhead of an effort that was to bring all-around emancipation from backwardness. If that effort is to fulfill its promise, the challenge posed by dismal politics must be met rather than avoided or evaded. By now it has become quite clear dragon of backwardness virtually by itself or, at least, that its poorer sections. Nevertheless, development economics started that this cannot be done by economics alone. It is for this reason versed: our subdiscipline had achieved its considerable luster and excitement through the implicit idea that it could slay the contribution to this task was central. We now know that this is that the decline of development economics cannot be fully renot so; a consoling thought is that we may have gained in maturity what we have lost in excitement.

believed to be "incapable of causing either good or evil on a grand scale."

A similar perception may have been at work in could a group of social scientists that had just lived through the ties, but rather on continuing contempt for them: unlike the passionate, aristocratic pursuit of glory and power with its then well-recognized potential for disaster, the love of money was Looking backward, the whole episode seems curious. How most calamitous "derailments of history" in various major economically advanced countries entertain such great hopes for economic development per se? Here I can perhaps offer some enlightenment by drawing on my recent work in the history of ideas. In The Passions and the Interests I showed that the rise of commerce and money-making activities in the seventeenth and eighteenth centuries was then looked upon as promising for political stability and progress; and I stressed that such optimistic expectations were not based on a new respect for these activi-Tinceton: Princeton University Press, 1977, p. 58.

In sum, like the "innocent" and doux trader of the eighteenth century, these countries were perceived to have only interests mate, poor resources, or inferior race. With the new doctrine of tries would be smoothly linear if only they adopted the right countries were expected to perform like wind-up toys and to "lumber through" the various stages of development singlemindedly; their reactions to change were not to be nearly as traumatic or aberrant as those of the Europeans, with their feudal residues, psychological complexes and exquisite high culture. economic growth, contempt took a more sophisticated form: suddenly it was taken for granted that progress of these counkind of integrated development program! Given what was seen as their overwhelming problem of poverty, the underdeveloped oped" in the twentieth had taken the form of relegating them to permanent lowly status, in terms of economic and other prospects, on account of unchangeable factors such as hostile clicould be raised adequately. At an earlier time, contempt for the countries designated as "rude and barbarous" in the eighteenth century, as "backward" in the nineteenth and as "underdevelrelation to the less developed countries of Asia, Africa, and Latin America of the twentieth century. The Western economists who looked at them at the end of World War II were convinced that these countries were not all that complicated: their major problems would be solved if only their national income per capita and no passions.

Once again, we have learned otherwise.
